1988
OVERVIEW

- The number of traffic fatalities decreased 9.0% over the past year from 510 deaths in 1987 to 464 deaths in 1988.
- The number of traffic injuries decreased 5.2% over the past year from 19,809 injuries in 1987 to 18,777 injuries in 1988.
- The number of traffic collisions increased 13.1% over the past year from 97,493 collisions in 1987 to 110,264 collisions in 1988.
- Casualty collisions occurred most frequently between June and August.
- Friday was the most collision-prone day of the week. However, the majority of fatal collisions occurred on Saturday.
- The most collision-prone period of time was the afternoon rush-hour.
- Fatal collisions occurred most frequently in rural areas, whereas injury and property damage only collisions occurred more frequently in urban areas.
- Casualty rates were highest for persons between the ages of 15 and 24.
- Male drivers between the ages of 18 and 19 were most likely to be involved in casualty collisions.
- Driver error was cited in 54.3% of casualty collisions.
- 29.7% of drivers involved in fatal crashes had consumed alcohol prior to the crash compared to 11.3% of drivers in injury crashes.
- Most of the fatally injured occupants were not restrained at the time of the crash. However, the majority of occupants who were restrained at the time of the crash sustained only minor injuries.

PREFACE

The purpose of this report is to provide an overview of the "who", "what", "when", "where", "why", and "how" of traffic collisions which occurred in Alberta during 1988. Although the report is general in nature, it pays particular attention to casualty collisions, that is, those collisions which resulted in death or injury. Since 1984, limited information is collected for crashes involving only property damage.

Legislation in Alberta requires that a traffic collision, which results in either death, injury or property damage to an apparent extent of \$500.00 or more, be reported immediately to an authorized peace officer. The officer completes a standardized collision report form which provides information on various aspects of the traffic collision. This report is based on the data collected from these report forms.

The collision report form is issued with standard instructions to every police force within Alberta, to be completed by the officer attending the scene of a motor vehicle crash. Police priorities at the scene of a crash are to care for the injured, protect the motoring public and clear the roadway. Completion of the collision report form is a secondary, but necessary task.

After completion, the information on the collision report form is coded for input to computer files. The Provincial Traffic Crash Information System, which has been operational since 1978, undergoes several manual and computerized inspections each year in order to ensure maximum accuracy of the final data output.

Due to continuing police investigation, some numbers presented in this report may be subject to revision. It should also be noted that not all percentage columns will total 100 due to rounding error. However, the patterns and trends detailed in this report represent an accurate description of Alberta's traffic collision picture.

Glossary

Alcohol Impaired	- In the judgement of the police officer, driving ability was impaired by alcohol consumption. Whether or not the subject was actually charged is not taken into consideration by the collision report form.
Casualty Collision	- A vehicle collision which results in either a fatality or personal injury.
Drinking Driver	- Refers to those drivers judged by the police officer, as having been drinking prior to the crash or as being alcohol impaired at the time of the crash. Whether or not the driver was actually charged is not taken into consideration by the collision report form.
Fatality	- A fatality is a death of a person that occurs as a result of a motor vehicle collision within 30 days of the collision.
Had Been Drinking	- In the judgement of the police officer, the driver had recently consumed alcohol but his driving ability was not obviously impaired.
Major Injury	- Persons with injuries or complaint of pain that went to the hospital and were subsequently admitted even if for observation only.
Minor Injury	- Persons with injuries or complaint of pain that went to the hospital, were treated in emergency (or refused treatment) and SENT HOME without ever being admitted to the hospital.
Motorcyclist	- Refers to drivers and passengers of motorcycles.
Occupant Casualties	- Refers to people who were injured or killed as a result of a vehicle collision and were identified as being either a vehicle driver or passenger.
Property Damage Only	- A vehicle collision which resulted in property damage only, to the extent of \$500.00 or more.
Reportable Collision	- A vehicle collision which resulted in death, injury or property damage greater than \$500.00.
Rural	- Any area outside of that defined as 'urban'.
Urban	- Any area within the corporate boundaries of a city, town, or village.

1988 TRAFFIC COLLISION SUMMARY

INTRODUCTION

- During 1988, 110,264 traffic collisions were recorded on Alberta roadways. Property damage only crashes (over \$500) represented 88.1% (97,141) of this total while 11.5% (12,728) were non-fatal injury collisions. Fatal crashes accounted for less than 0.4% (395) of the total reported collisions.

FIVE YEAR TRENDS

- Over the five year period, the fatality rate rose in 1985, but has fallen each year since. The fatal collision rate, in terms of 10,000 population, stands at 1.6 in 1988, a five year low.
- Non-fatal injury collision rates and non-fatal injury rates increased in 1985 and 1986, but fell again in 1987 and 1988. In 1988, the non-fatal injury collision rate, in terms of 10,000 population, stands at 53.1, down from 1987 (55.0).
- In terms of 10,000 population, property damage and total collision rates now stand at 405.6 and 460.4, respectively. This is an increase from 1987.

PROVINCIAL COMPARISONS

- In order to get a clear picture of Alberta's traffic injuries, in comparison to other provinces, rates rather than absolute numbers are utilized. In this instance, injury rates per 10,000 population were examined.
- In 1988, three provinces (British Columbia, Saskatchewan and New Brunswick) recorded higher fatality rates than Alberta in terms of 10,000 population.

Table 1.1

TOTAL Number of Casualties	19241	20319	22671	20388	19425

OBSERVATIONS

In 1988, the overall number of collisions increased 13.1% when compared to 1987. However, in 1988, injury collisions decreased 2.8% while fatal crashes decreased 7.1%. The number of fatalities has decreased by 9.0% from 1987 to 1988, and the number of injuries decreased by 5.2%. In terms of the past five years, overall collisions increased from 1984 to 1985, decreased in 1986, increased slightly in 1987, and rose in 1988.

Table 1.2
(Continued)

OBSERVATIONS

Fatal collision rates in terms of licensed drivers, population and registered vehicles remained almost constant until 1987, dropping slightly in 1988. In 1988 the non-fatal injury collision rate decreased over 1987, while property damage and total collision rates have increased.

Sources: Casualty statistics supplied by each province. Population estimates, as of June 1, 1988, Statistics Canada, Demography Division, March 1989.

OBSERVATIONS

During 1988, for the provinces where information was available, three provinces, British Columbia, Saskatchewan and New Brunswick, recorded a higher fatality rate than Alberta. However, only two provinces, Prince Edward Island and Newfoundland, recorded a lower rate of non-fatal injuries per 10,000 population.

* Not available at time of printing.

PROVINCIAL TRAFFIC FATALITY RATES Per 10,000 Population 1988

Figure 2

WHEN THE COLLISIONS OCCURRED

MONTH

- The months of June to October experienced more casualty collisions than other months. The highest number of property damage only collisions was recorded during the month of November.

DAY OF WEEK

- The daily distribution of collisions indicated that Friday was the most collision - prone day of the week. The largest number of fatal crashes occurred on Saturday.

TIME

- The afternoon rush hour period (3 p.m. - 6:59 p.m.) accounted for the highest proportion of collisions. The least collision - prone time period was the early morning (3 a.m. - 6:59 a.m.)

HOLIDAYS

- The Remembrance Day weekend recorded the greatest number of traffic collisions for a holiday period in 1988. The 1988 Easter long weekend recorded the highest total number of deaths.

TOTAL Number of Collisions	395	100.0	12728	100.0	97141	100.0	110264	100.0

OBSERVATIONS

The afternoon rush hour period (3:00 p.m. - 6:59 p.m.) accounted for the largest percentage (27.2%) of collisions occurring in a 24 hour period. The least collision - prone time period was the early morning (3:00 a.m. - 6:59 a.m.).

COLLISIONS DURING 1988 HOLIDAYS

<u>Holidays</u>	Number Killed		Number Injured		TOTAL* COLLISIONS	
	N	%	N	%	N	%
New Year's Day (January 1)	1	2.3	26	1.4	292	3.2
Easter (March 31 - April 4)	10	23.3	202	10.7	1124	12.1
Victoria Day (May 20 - 23)	3	7.0	213	11.3	969	10.5
Canada Day (June 30 - July 3)	5	11.6	267	14.2	1088	11.8
August Long Weekend (July 29 - August 1)	6	14.0	308	16.3	1181	12.8
Labour Day (September 2 - 5)	4	9.3	259	13.7	1088	11.8
Thanksgiving (October 7 - 10)	2	4.7	225	11.9	1041	11.2
Remembrance Day (November 10 - 13)	4	9.3	217	11.5	1511	16.3
Christmas Season (December 23 - 26)	8	18.6	167	8.9	957	10.3
TOTAL	43	100.0	1884	100.0	9251	100.0

OBSERVATIONS

The five-day Easter weekend recorded the highest number of individuals killed. The Remembrance Day weekend recorded the highest number of total collisions.

* Includes fatal, injury and property damage only collisions.

VICTIMS

ROAD USER CLASS

- The majority of traffic victims were drivers and passengers of vehicles. Pedestrians and motorcyclists accounted for 6.3% and 4.6% of the total casualties, respectively.

AGE OF CASUALTIES

- Casualty rates per 10,000 population were highest for persons between the ages of 15 and 24. The lowest casualty rates were recorded for children 14 and under and people 65 years of age and over.

Table 3.1
INJURIES AND FATALITIES

Unspecified	-	-	361	1.9	
TOTAL	464	100.0	18777	100.0	

OBSERVATIONS

Casualty rates per 10,000 population were highest for persons between the ages of 15 and 24. The lowest casualty rates were recorded for children (14 years of age and younger) and people 65 and over.

* Based on estimates of the Alberta population by age groups and sex, June 1, 1988, Alberta Bureau of Statistics, February, 1989.

AGE OF CASUALTIES

CASUALTY RATE PER 10,000 POPULATION

1988

Figure 4

DRIVER COMPONENT

AGE AND SEX OF DRIVERS

- Collision rates per 1000 licensed drivers indicated that 18-19 year olds were more likely to be involved in a casualty collision than any other age group. The next age group most likely to be involved were 16 to 17 year olds.

DRIVER ACTIONS

- Driver error or misjudgement was involved in approximately 54.3% of casualty collisions. Running off the road, failing to observe a traffic control device and travelling at an unsafe speed were the most frequent driver actions contributing to casualty collisions.

TOTAL Number of Drivers	591	100.0	19556	100.0	20147	100.0

OBSERVATIONS

Driver error or misjudgement was involved in 54.3% of casualty collisions. Running off the road, failing to observe traffic control device, and travelling at an unsafe speed were the most frequently identified driver actions contributing to casualty collisions.

* Includes only those cases where driver action was specified on the collision report form. Driver action was unspecified for 26 drivers involved in fatal collisions and 1581 drivers in non-fatal injury collisions.

VEHICLE COMPONENT

TYPES OF VEHICLES

- Passenger cars and pick up trucks/vans were the vehicles most frequently involved in total casualty collisions. Motorcycles were involved in 3.7% of casualty collisions and bicycles were involved in 3.2% of casualty collisions.

VEHICULAR FACTORS

- Vehicle defects played a minor role in casualty collisions. Less than 3% of vehicles involved in casualty collisions were identified as having a vehicle defect. The most common defects involved tire failure and defective brakes.

POINT OF IMPACT

- The most common point of impact in casualty collisions involved the front of the vehicle. Approximately 38% of the impacts involved the centre front.

Table 5.1
TYPES OF VEHICLES INVOLVED IN
CASUALTY COLLISIONS
1988

<u>Type of Vehicle</u>	Vehicles in Fatal Collisions		Vehicles in Non-Fatal Injury Collisions		Total Vehicles in Casualty Collisions	
	N	%	N	%	N	%

Right Side	44	7.2	1139	5.7	1183	5.7
Left Side	40	6.6	1163	5.8	1203	5.8
Centre Rear	15	2.5	2676	13.3	2691	13.0
Right Rear	16	2.6	648	3.2	664	3.2
Left Rear	15	2.5	588	2.9	603	2.9
Top	4	0.7	54	0.3	58	0.3
Undercarriage	3	0.5	153	0.8	156	0.8
Rollover	120	19.7	1830	9.1	1950	9.4
TOTAL Number of Vehicles	609	100.0	20098	100.0	20707	100.0

OBSERVATIONS

The most common point of impact in casualty collisions involved the front of the vehicle. Approximately 38% of the impacts involved the centre front, while 13.0% of the impacts involved the centre rear and 10.4% involved the right front.

* Includes only those cases in which point of impact was specified on the collision report form. Point of impact was unspecified for 18 vehicles in fatal collisions and 1285 vehicles in non-fatal injury collisions.

ENVIRONMENTAL COMPONENT

LOCATION

- The majority of fatal crashes occurred in rural areas, whereas the majority of injury and property damage only crashes occurred in urban areas.

SURFACE CONDITION

- The majority (60.5%) of the casualty collisions occurred when surface conditions were dry. Snow/ice were present in 15.2% of the casualty crashes.

ROAD LOCATION

- Approximately 46.7% of casualty collisions were intersection-related. However, fatal collisions were more likely to be non-intersection related (64.8%).

Table 6.1
LOCATION OF COLLISIONS
1988

<u>Location</u>	Fatal Collisions		Non-Fatal Injury Collisions		Property Damage Only Collisions		Total Collisions	
	N	%	N	%	N	%	N	%
Urban	123	31.1	8940	70.2	80525	82.9	89588	81.2
Rural	272	68.9	3788	29.8	16616	17.1	20676	18.8
TOTAL Number of Collisions	395	100.0	12728	100.0	97141	100.0	110264	100.0

OBSERVATIONS

Collisions which occurred in rural areas accounted for 68.9% of all fatal crashes. Collisions occurring in urban areas resulted in the highest proportion of non-fatal injury collisions (70.2%) and property damage only crashes (82.9%).

Table 6.2
CASUALTY COLLISION OCCURRENCE
BY SURFACE CONDITION
1988

<u>Surface Condition</u>	Fatal Collisions		Non-Fatal Injury Collisions		Total Casualty Collisions	
	N	%	N	%	N	%

Off Highway	1	0.3	51	0.4	52	0.4
At/Near Service Road	5	1.3	104	0.8	109	0.8
At/Near Railroad Crossing	9	2.3	66	0.5	75	0.6
Unspecified	-	-	17	0.1	17	0.1
TOTAL Number of Collisions	395	100.0	12720	100.0	13115	100.0

OBSERVATIONS

46.7% of casualty collisions were intersection-related. Fatal collisions were more likely to be non-intersection related (64.8%).

SPECIAL TYPES OF VEHICLES

MOTORCYCLES

- The injury motorcycle collision rate based on motorcycle registrations decreased from 1987, while the fatal motorcycle collision rate increased.
- The majority of motorcycle casualty collisions involved male drivers. Motorcycle drivers under the age of 25 were the age group most likely to be involved in these collisions. In particular 16 and 17 year old motorcycle drivers had an involvement rate per 1,000 licenced drivers of 64.1, a rate over four times greater than that of the 20-24 year old motorcycle drivers.
- Compared to drivers involved in all types of vehicle collisions, motorcycle drivers were less likely to fail to yield right-of-way, to fail to observe a traffic control device, or make a left turn across the path of an oncoming vehicle. However, motorcycle drivers were more likely to drive at an unsafe speed or pass improperly.
- Compared to drivers involved in all types of vehicle casualty collisions, motorcycle drivers were more likely to have consumed alcohol before the crash.
- Vehicular factors were involved in 4.0% of motorcycle casualty collisions compared to 2.2% of casualty collisions involving all types of vehicles.
- The majority of casualty collisions involving motorcycles occurred on dry roads.

TRACTOR - TRAILERS

- In 1988, there were 52 persons killed and 569 injured in collisions involving tractor-trailers. This represents an increase in casualties over 1987.
- Compared to drivers of other vehicles, tractor-trailer drivers were more likely to run off the road.

- Tractor-trailer drivers were less likely to consume alcohol before the crash than were drivers of other types of collision - involved vehicles.
- Vehicular factors were more likely to be present in tractor-trailer casualty collisions than in casualty collisions involving other types of vehicles.
- The occurrence of casualty collisions involving tractor-trailers was highest in the months of January and August.

TRAINS

- In 1988, 11 people were killed and 43 people were injured in crashes in which a train was involved. The number of casualties involving trains has increased from 1987.
- The majority of injury collisions involving trains occurred in the month of August. The majority of fatal collisions involving trains occurred in the month of December.
- A large percentage of drivers involved in a collision with a train either failed to observe the traffic control device (56.4%) or failed to yield right-of-way to the train (17.9%).

Table 7.1
CASUALTY COLLISIONS INVOLVING MOTORCYCLES
1984 - 1988

	1988	1987	1986	1985	1984

35 - 44	82	10.2	23	2.9	106	13.2	2.4
45 - 54	32	4.0	18	2.2	51	6.3	3.7
55 - 64	15	1.9	5	0.6	20	2.5	3.1
65 and over	16	2.0	8	1.0	24	3.0	12.5
Unspecified	4	0.5	-	-	18	2.2	
TOTAL Number of Motorcycle Drivers	672	83.5	116	14.4	805	100.0	

OBSERVATIONS

The majority of motorcycle casualty collisions involved male drivers. Motorcycle drivers under the age of 25 were the age group most likely to be involved in collisions. In particular, 16 and 17 year old motorcycle drivers had a high involvement rate. The age group least likely to be involved in collisions were drivers 55-64 years of age. **These age and sex comparisons are limited due to the lack of driving exposure data.** That is, in order to make valid age comparisons, it is important to take into account the number of kilometres driven annually by each age and sex group of motorcycle operators.

* Total includes drivers whose sex was not specified on the collision report form.

** Source: Alberta Solicitor General - Motor Vehicles Division. Operator Statistics, December 31, 1988.

Table 7.3
CASUALTY COLLISIONS
INVOLVING MOTORCYCLES:
ACTION OF MOTORCYCLE DRIVER*
1988

<u>Driver Action</u>	N	%	Driver Action in Total Casualty Collisions (All Vehicle Types)
			%
Driving Properly	324	44.4	45.7
Unsafe Speed	150	20.5	6.0
Ran Off Road	40	5.5	7.4
Followed Too Closely	31	4.2	5.4
Failed to Observe Traffic Control Device	25	3.4	6.5
Improper Passing	18	2.5	0.8
Failed to Yield Right-of-Way	15	2.1	5.0
Improper Turn	9	1.2	1.5
Left of Centre	7	1.0	1.6
Left Turn Across Path	6	0.8	4.9
Entered Lane When Unsafe	6	0.8	1.8
Failed to Signal	1	0.1	0.1
Other	98	13.4	12.3
TOTAL Number of Motorcycle Drivers	730	100.0	

OBSERVATIONS

Improper driver actions were a contributory factor for 55.6% of the motorcyclists involved in casualty collisions. Compared to drivers involved in other types of vehicle casualty collisions, motorcycle drivers were more likely to drive at an unsafe speed, or pass improperly. However, motorcycle drivers were less likely to fail to yield right-of-way, to fail to observe a traffic control device, or make a left turn across the path of an oncoming vehicle.

* Based only on cases where driver action was specified on the collision report form.
A driver action was unspecified in 75 cases.

Table 7.4
CASUALTY COLLISIONS
INVOLVING MOTORCYCLES:
CONDITION OF MOTORCYCLE DRIVER*
1988

<u>Driver Condition</u>	N	%	Driver Condition in Total Casualty Collisions (All Vehicle Types) %
Normal	583	81.5	86.5
Had Been Drinking	92	12.9	7.0
Alcohol Impaired	36	5.0	4.8
Other	4	0.6	1.7
TOTAL Number of Motorcycle Drivers	715	100.0	

OBSERVATIONS

The motorcycle driver's condition was a contributory factor for 18.5% of these crashes. Compared to drivers involved in other types of vehicle casualty collisions, motorcycle drivers were more likely to have consumed alcohol prior to the crash.

* Based only on cases where driver condition was specified on the collision report form.
Driver condition was unspecified in 90 cases.

Table 7.5
CASUALTY COLLISIONS
INVOLVING MOTORCYCLES:
VEHICULAR FACTORS*
1988

<u>Vehicular Factors</u>	N	%	Vehicular Factors in Total Casualty Collisions (All Vehicle Types)
			%
No Defect Present	680	96.0	97.8
Tire Failure/Inadequate	10	1.4	0.5
Lighting Defect	4	0.6	0.3
Defective Brakes	4	0.6	0.5
Other	10	1.4	0.9
TOTAL Number of Motorcycles	708	100.0	

OBSERVATIONS

Vehicular factors were involved in 4.0% of motorcycle casualty collisions, compared to 2.2% in casualty collisions involving other types of vehicles. In particular, motorcycles were twice as likely as other vehicle types to experience tire failure or lighting defects.

* Based only on cases where a vehicular factor was specified on the collision report form.
A vehicular factor was unspecified in 97 cases.

Table 7.6
CASUALTY COLLISIONS
INVOLVING MOTORCYCLES:
MONTH OF OCCURRENCE
1988

<u>Month</u>	<u>N</u>	<u>%</u>
January	2	0.2
February	6	0.8
March	26	3.3
April	105	13.2
May	123	15.5
June	134	16.9
July	138	17.4
August	109	13.7
September	80	10.1
October	60	7.6
November	7	0.9
December	4	0.5
TOTAL Number of Collisions	794	100.0

OBSERVATIONS

The months of April to August recorded the highest proportion of casualty crashes involving motorcycles.

Table 7.7
CASUALTY COLLISIONS
INVOLVING MOTORCYCLES:
ROAD SURFACE CONDITION*
1988

<u>Road Surface Condition</u>	N	%
Dry	627	86.8
Loose Material	48	6.6
Wet	38	5.3
Snowy/Icy	2	0.3
Other	7	1.0
TOTAL Number of Collisions	722	100.0

OBSERVATIONS

The majority of casualty collisions involving motorcycles occurred on dry roads. However, 5.3% of the collisions occurred on wet road surfaces. Loose material on the road surface was involved in 6.6% of motorcycle casualty crashes.

* Based only on collisions where road surface condition was specified on the collision report form. Road condition was unspecified in 72 cases.

Table 7.8
CASUALTY COLLISIONS INVOLVING TRACTOR-TRAILERS
1984-1988

<u>Number of Tractor-Trailers</u>	1988	1987	1986	1985	1984
	N	N	N	N	N
Fatal	41	55	53	63	47
Non-Fatal Injury	392	359	425	433	422
TOTAL Number of Tractor-Trailers	433	414	478	496	469
<u>Casualties*</u>					
Number Killed	52	63	65	86	54
Number Injured	569	529	607	646	646
TOTAL Casualties	621	592	672	732	700

OBSERVATIONS

In 1988, there were 52 persons killed and 569 injured in collisions involving tractor-trailers. This represents an increase in casualties from 1987. The total number of tractor-trailers involved in casualty crashes also increased in 1988, standing at 433 compared to the five-year high of 496 recorded in 1985.

* This refers to the number of people killed and injured in collisions in which a tractor-trailer was involved. It does not refer to the number of tractor-trailer drivers killed and injured.

Table 7.9
CASUALTY COLLISIONS
INVOLVING TRACTOR-TRAILERS:
DRIVER ACTION*
1988

<u>Driver Action</u>	<u>N</u>	<u>%</u>	<u>Driver Action in Total Casualty Collisions (All Vehicle Types) %</u>
Driving Properly	237	60.6	45.7
Ran Off Road	50	12.8	7.4
Followed Too Closely	20	5.1	5.4
Unsafe Speed	13	3.3	6.0
Failed to Observe Traffic Control Device	11	2.8	6.5
Improper Turn	7	1.8	1.5
Left Turn Across Path	5	1.3	4.9
Failed to Yield Right-of-Way	4	1.0	5.0
Improper Passing	3	0.8	0.8
Left of Centre	3	0.8	1.6
Entered Lane When Unsafe	2	0.5	1.8
Backed Unsafely	2	0.5	0.7
Other	34	8.7	12.3
TOTAL Number of Drivers	391	100.0	

OBSERVATIONS

Improper driver actions were exhibited by approximately 39% of the tractor-trailer drivers involved in casualty collisions. Compared to drivers of other vehicles, tractor-trailer drivers were more likely to run off the road. However, operators of tractor-trailers were less likely than other vehicle operators to fail to observe a traffic control device, drive at an unsafe speed, fail to yield the right-of-way, or make an unsafe left turn.

* Based only on those cases where driver action was specified on the collision report form.
Driver action was unspecified in 21 cases.

Table 7.10
CASUALTY COLLISIONS
INVOLVING TRACTOR-TRAILERS:
DRIVER CONDITION*
1988

<u>Driver Condition</u>	N	%	Driver Condition in Total Casualty Collisions (All Vehicle Types) %
Normal	368	95.8	86.5
Had Been Drinking	4	1.0	7.0
Alcohol Impaired	2	0.5	4.8
Other	10	2.6	1.7
TOTAL Number of Drivers	384	100.0	

OBSERVATIONS

The condition of the tractor-trailer driver was a contributory factor for only 4.1% of the drivers involved. Tractor-trailer drivers were less likely to consume alcohol before the crash than were drivers of other types of collision-involved vehicles.

* Based only on cases where driver condition was specified on the collision report form.
Driver condition was unspecified in 28 cases.

Table 7.11
CASUALTY COLLISIONS
INVOLVING TRACTOR-TRAILERS:
VEHICULAR FACTORS*
1988

<u>Vehicular Factors</u>	N	%	Vehicular Factors in Total Casualty Collisions (All Vehicle Types) %
No Defect Present	358	94.7	97.8
Tire Failure/Inadequate	5	1.3	0.5
Defective Brakes	4	1.1	0.5
Lighting Defect	2	0.5	0.3
Other	9	2.4	0.9
TOTAL Number of Tractor-Trailers	378	100.0	

OBSERVATIONS

Vehicular factors were involved in 5.3% of tractor-trailer casualty collisions. Vehicular factors were more likely to be present in tractor-trailer collisions than in collisions involving other types of vehicles.

* Based only on those cases where vehicular factor was specified on the collision report form. Vehicular factors were unspecified in 55 cases.

Table 7.12
CASUALTY COLLISIONS
INVOLVING TRACTOR-TRAILERS:
MONTH OF OCCURRENCE
1988

<u>Month</u>	N	%
January	50	11.9

Unspecified	-	-	2	6.5	2	5.1
TOTAL Number of Drivers	8	100.0	31	100.0	39	100.0

OBSERVATIONS

A large percentage of drivers involved in collision with a train either failed to observe the traffic control device (56.4%) or failed to yield right-of-way to the train (17.9%).

PEDESTRIANS AND BICYCLISTS

PEDESTRIANS

- Pedestrian casualty collisions were fairly evenly distributed across all months of the year. September to December accounted for the largest number of collisions, while August experienced the least number of pedestrian crashes.
- Pedestrian casualty collisions were most likely to occur on Thursdays and Fridays and least likely to occur on Sundays.
- Pedestrian casualty collisions were most likely to occur during the evening rush-hour period.
- Drivers failed to yield the right-of-way to pedestrians in 23.3% of the collisions.
- The casualty rate per population was highest for pedestrians between the ages of 5 and 19.

BICYCLISTS

- Casualty collisions involving bicycles were more likely to occur between the months of May and August.
- Wednesdays and Fridays experienced the most casualty collisions involving bicycles. As well, the largest number of these crashes (39.9%) occurred during the evening rush-hour period.
- The majority of bicycle casualty crashes involved young bicyclists, 10-19 years of age.
- The action of the bicyclist involved contributed to nearly 66% of these casualty crashes. The most commonly cited bicyclist actions were failing to yield the right-of-way, failing to observe a traffic control device, and entering a lane when unsafe.

Table 8.1
CASUALTY COLLISIONS INVOLVING PEDESTRIANS:
MONTH OF OCCURRENCE
1988

<u>Month of Collision</u>	<u>N</u>	<u>%</u>
January	86	7.5

7:00 p.m. - 10:59 p.m.	211	18.3
Unspecified	17	1.5
TOTAL Number of Collisions	1150	100.0

OBSERVATIONS

Pedestrian casualty collisions were most likely to occur during the evening rush-hour period from 3:00 p.m. to 6:59 p.m. These collisions were least likely to occur during the early morning hours.

Table 8.4
CASUALTY COLLISIONS INVOLVING PEDESTRIANS:
LOCATION
1988

<u>Location</u>	N	%
Urban	1085	94.3
Rural	65	5.7
TOTAL Number of Collisions	1150	100.0

OBSERVATIONS

The majority of pedestrian casualty collisions (94.3%) occurred in urban areas. Only 5.7% occurred in rural areas.

Table 8.5
CASUALTY COLLISIONS INVOLVING PEDESTRIANS:
DRIVER ACTION*
1988

<u>Driver Action</u>	N	%	Driver Action in Total Casualty Collisions (All Vehicle Types) %
Driving Properly	478	45.1	45.7
Failed to Yield Right of Way	247	23.3	5.0
Backed Unsafely	37	3.5	0.7
Unsafe Speed	32	3.0	6.0
Failed to Observe Traffic Control Device	30	2.8	6.5
Ran Off Road	9	0.8	7.4
Improper Turn	8	0.8	1.5
Left of Centre	5	0.5	1.6
Improper Passing	4	0.4	0.8
Followed too Closely	4	0.4	5.4
Left Turn Across Path	3	0.3	4.9
Entered Lane When Unsafe	1	0.1	1.8
Other	203	19.1	12.3
TOTAL Number of Drivers	1061	100.0	

OBSERVATIONS

In 45.1% of the collisions involving pedestrians the driver action was noted as driving properly. However, compared to total casualty collisions, drivers involved in pedestrian casualty collisions were almost five times as likely to fail to yield right of way (23.3%).

* Based only on those cases where a driver action was specified on the collision report form. Driver action was unspecified in 104 cases.

Table 8.6
AGE OF PEDESTRIAN
CASUALTIES
1988

<u>Age in Years</u>	Pedestrians Killed	Pedestrians Injured	Total Pedestrian Casualties		Pedestrian Casualty Rate Per 10,000 Population*

Unspecified	18	2.6	8	1.1	31	4.4
TOTAL Number of Bicyclists	515	73.4	177	25.2	702	100.0

OBSERVATIONS

The majority of bicycle casualty collisions involved male bicyclists. The 10-19 year old age group was most frequently involved in these collisions.

* Total includes bicyclists whose sex was not specified on the collision report form.

Table 8.11
CASUALTY COLLISIONS INVOLVING BICYCLES:
ACTION OF BICYCLIST*
1988

<u>Action of Bicyclist</u>	N	%	Driver Action in Total Casualty Collisions (All Vehicle Types) %
Driving Properly	218	34.5	45.7
Failed to Yield Right of Way	72	11.4	5.0
Failed to Observe Traffic Control Device	50	7.9	6.5
Entered Lane When Unsafe	27	4.3	1.8
Left Turn Across Path	21	3.3	4.9
Left of Centre	16	2.5	1.6
Improper Turn	11	1.7	1.5
Unsafe Speed	5	0.8	6.0
Improper Passing	5	0.8	0.8
Followed Too Closely	5	0.8	5.4
Failed to Signal	3	0.5	0.1
Ran Off Road	2	0.3	7.4
Backed Unsafely	1	0.2	0.7
Other	196	31.0	12.3
TOTAL Number of Bicyclists	632	100.0	

OBSERVATIONS

Improper actions on the part of the bicyclist were a contributory factor in nearly 66% of these casualty crashes. Compared to operators of other vehicles, bicyclists were more likely to fail to yield right-of-way, enter a lane when unsafe or fail to observe a traffic control device.

* Based only on cases where driver action was specified on the collision report form. Action of the bicyclist was unspecified in 70 cases.

TRAFFIC SAFETY ISSUES

ALCOHOL INVOLVEMENT

- A total of 11.3% of drivers involved in injury crashes were judged to have consumed alcohol prior to the crash, compared to 29.7% of drivers involved in fatal collisions. As the severity of the collision increased, the involvement of alcohol dramatically increased.
- In terms of involvement per 1,000 licensed drivers, males between 18 and 21 years of age were most likely to have been drinking before the crash. There were over six times as many male drivers as female drivers who had consumed alcohol prior to the collision.
- In 1988, alcohol related casualty crashes were most likely to have occurred between June and September, on Saturday, and between 11:00 p.m. and 2:59 a.m.
- Figure 8 provides a graphic representation of the involvement of drinking drivers in casualty collisions over the five years, 1984-1988.

RESTRAINT USE

- The collision report form collects restraint use information for **occupants killed or injured in a collision**. The form does not collect restraint use information for individuals involved in a collision who were not killed or injured.
- Most of the fatally injured occupants were not restrained at the time of the crash. However, the majority of occupants who were restrained at the time of the crash sustained only minor injuries.

Table 9.1
CONDITION OF DRIVERS IN CASUALTY COLLISIONS*
 1988

<u>Condition of Driver</u>	Drivers in Fatal Collisions		Drivers in Non-Fatal Injury Collisions		Total Drivers In Casualty Collisions	
	N	%	N	%	N	%
Normal	352	68.8	16649	87.0	17001	86.5
Had Been Drinking	96	18.8	1279	6.7	1375	7.0
Alcohol Impaired	56	10.9	878	4.6	934	4.8
TOTAL Alcohol Involvement	152	29.7	2157	11.3	2309	11.8
Other	8	1.6	333	1.7	341	1.7
TOTAL Number of Drivers	512	100.0	19139	100.0	19651	100.0

OBSERVATIONS

Of drivers involved in injury collisions, 11.3% had consumed alcohol before the crash, compared to 29.7% in fatal collisions. As the severity of the collision increased, the involvement of alcohol dramatically increased. Overall, 11.8% of drivers involved in casualty collisions were judged to have consumed alcohol before the crash.

* Based only on cases where driver condition was specified on the collision report form. Driver condition was unspecified for 105 drivers in fatal collisions and 1998 drivers in non-fatal injury collisions.

TOTAL									
Number of Drivers	1983	85.9		307	13.3		2309	100.0	

OBSERVATIONS

Of those collision-involved drivers who had consumed alcohol, there were over 6 times as many male drivers as female drivers. The majority were male drivers under the age of 30. In terms of involvement per 1,000 licensed drivers, males 18-21 years of age are more likely to have consumed alcohol prior to a casualty collision than any other age group. After the age of 30, alcohol involvement decreased for both male and female drivers.

* Total includes drinking drivers whose sex was not specified on the collision report form. Drinking drivers include those indicated on the collision report form as having been drinking prior to the crash and those who were alcohol-impaired at the time of the crash. Whether or not the driver was actually charged is not taken into consideration by the collision report form.

December	11	7.5	142	6.8	153	6.8
TOTAL Number of Collisions	147	100.0	2087	100.0	2234	100.0

OBSERVATIONS

The months of June to September accounted for the largest proportion of alcohol-involved casualty collisions. The months of January, February and December accounted for the smallest proportion of alcohol-involved casualty collisions.

TOTAL Number of Collisions	147	100.0	2087	100.0	2234	100.0

OBSERVATIONS

The highest number of alcohol-involved fatal (29.9%) and injury (25.9%) collisions occurred on Saturdays. The smallest number of alcohol-involved casualty collisions occurred on Mondays.

11:00 a.m. - 2:59 p.m.	10	6.8	98	4.7	108	4.8
3:00 p.m. - 6:59 p.m.	16	10.9	286	13.7	302	13.5
7:00 p.m. - 10:59 p.m.	34	23.1	483	23.1	517	23.1
Unspecified	1	0.7	61	2.9	62	2.8
TOTAL Number of Collisions	147	100.0	2087	100.0	2234	100.0

OBSERVATIONS

The late night/early morning time period (11:00 p.m. - 2:59 a.m.) was most likely to record alcohol-involved casualty collisions (32.7%). The morning hours (7:00 a.m. - 10:59 a.m.) were least likely to record alcohol-involved casualty crashes (4.3%).

Table 9.6
**RESTRAINT USE OF OCCUPANT CASUALTIES
 AND INJURY SEVERITY
 1988**

Injury Severity	Percent Using Restraints
Fatal	38.8
Major	58.4
Minor	82.0

OBSERVATIONS

The collision report form collects seat belt use for killed and injured occupants only. Most of the fatally injured occupants were not restrained at the time of the crash. However, the majority of occupants who were restrained at the time of the crash sustained only minor injuries.

The mandatory seat belt law was in force for the entire year of 1988. The fine for non-compliance was \$25.00. This may have caused some injured occupants to report wearing seat belts when they were not.

Injury Severity

Fatal - A fatal injury is a death of a person that occurs as a result of a motor vehicle collision within 30 days of the collision.

Major - Persons with injuries or complaint of pain that went to the hospital and were subsequently admitted even if for observation only.

Minor - Persons with injuries or complaint of pain that went to the hospital were treated in emergency (or refused treatment) and SENT HOME without ever being admitted to the hospital.
